TRADING STRATEGY AND RISK MANAGEMENT

GTRADER.ME

Automated spot trading platform connected to clients with Binance accounts.

G-TRADER

HOW DOES GTRADER OPERATE?

For the customer it is fully automatic and the capital is always in Binance accounts under the control of each user.

We trade Spot in 4 quarters, the capital is divided into four quarters and staggered trades are placed.

Gtrader buys at market and places a limit order with a target profit percentage and a Stop Loss of 10% on each quarter.

If a trade is returned against, the maximum damage to an account is 2.5%.

We only trade the most stable market currencies with the highest volume.

BTC - USDT - LTC - BNB - ETH - TWT

GTRADER TRADING TEAM

Gtrader's trading team is made up of three departments that interact to make decisions on each trade.
DEPARTMENT OF TECHNICAL MARKET ANALYSIS

This department analyses the market and the currency pairs traded in different time frames: long term (one year), medium term (monthly) and short term (weekly).

Every Sunday they establish two support and two resistance.

This analysis is based on indicators such as technical analysis, Eliot waves, Gauss bell, cycle states, and positive and negative memories built in the market.

DEPARTMENT
RISK MANAGEMENT

It analyses the specific situation of each currency in which it operates and checks the relevant information that could affect the evolution of these currencies, fundamentals, etc.

DEPARTMENT
OPERATIONAL

It deals with the placement of orders, analyses the trend of the pairs (bullish, bearish, sideways), location based on 20 and 200 period EMAs, events and sets the entries, always at low supports for the USDT robot. And for the BTC robot, it analyses decorrelations that occur in the pairs and also trades in Short when the BTC is at its maximum resistances.
